Aflatoxin B1 (AFB1) is a carcinogenic compound that exerts effects on ovarian function. In the present study, AFB1-induced NF-kappaB activation was examined in bovine granulosa cells and luteal cells by use of electrophoretic mobility shift assay (EMSA). Exposure of bovine granulosa cells to AFB1 (10 microM) for 24 h significantly increased the nuclear content of NF-kappa p65 and its p50 subunit, and these changes were accompanied by an increase in basal and IL-1beta-induced (5 ng/ml) NF-kappaB DNA binding activity. Similarly, AFB1-treated granulosa cells exhibited significantly increased NF-kappaB DNA binding activity after a 24-h incubation with IL-1beta, a prominent inducer of NF-kappaB activity in granulosa cells. IL-1beta also increased NF-kappaB DNA binding activity in luteal cells incubated with 10 microM AFB1 for 24 h. The AFB1-induced changes in NF-kappaB DNA binding activity in granulosa cells were blocked by pre-treatment with the antioxidant n-acetylcysteine. These results indicate that AFB1 induces NF-kappaB activity in bovine granulosa cells and luteal cells and suggest that activation of NF-kappaB may be an important mechanism by which AFB1 exerts its adverse effects on ovarian function.The Southeastern U.S. is No. 1 in the nation for most U.S. population and U.S. military strength.
