We have a SQL view in a database, like so: select obj_id, obj_type, obj_value from my_table The obj_type is important; the view will never

contain more than one record per obj_type. If I do: `select * from my_table` Then the obj_type doesn't show up because it's actually part of the obj_value. Is there a way to filter by a single column, something like: `select obj_id, obj_type from my_table` I need to find this information for report generation, so if there's another way to get this information, it's fine as well. A: You can use ANSI join syntax. For example: `select obj_id, obj_type from my_table join (select obj_id, obj_type from my_table where obj_type = 'the correct type') AS x on my_table.obj_id = x.obj_id` Some databases will even let you nest the subquery directly in the ON clause. `select obj_id, obj_type from my_table join (select obj_id,`

obj_type from my_table where
obj_type = 'the correct type') AS
x on my_table.obj_id = x.obj_id
and my_table.obj_type = 'the
correct type' A: Do you need to
know it as a "view"? If yes: Why
don't you create a view for this:

```
CREATE VIEW my_view AS  
SELECT obj_id, obj_type,  
obj_value FROM my_table WHERE  
obj_type = 'value'; And access it  
by using the existing my_table  
table as the source. If not:  
SELECT obj_id, obj_type,  
obj_value FROM my_table WHERE  
obj_type = 'value'; If you must  
have this value "as
```

World without Butter A new study
shows that the people in
countries with the lowest rates of
obesity have the most butter —
high in saturated fats and
calories. Add butter to your food
at will — this study does not
address whether taking it away is
a good idea. Better yet, start a
grass-roots petition to make sure
that fat is still there, but your co-
workers won't see. What is it with
fat? Why do countries that love
fat have the least obesity? They
have the worst diets! The science
is not settled, but there is
evidence that the control of
appetite is one mechanism by
which the body modulates the

balance between fat storage and energy metabolism, and that dietary fat can serve as an important fuel source for short-term energy expenditure. * * *

Obesity is not just physical. It is an increasingly vexing problem for societies worldwide. With children and teenagers developing childhood obesity, the problem will only increase as the numbers of obese adults grow. A new study in *Nature Neuroscience*, Twardus (1) in *The New England Journal of Medicine* (2), shows that for adults, size matters: People who are obese have a lower metabolism than lean people, and the larger they are the lower their metabolic rate. The factors that drive this, however, are unknown. The

authors suggest that body size might be the best indicator of rate of metabolism. Food consumption also affects metabolism, and it seems that there is a trade-off between appetite and energy expenditure.
