Crucial role of mitogen-activated protein kinase phosphatase-1 in granzyme B-induced apoptosis. The Fas death receptor (FasR) and the tumor necrosis factor (TNF)-related apoptosis-inducing ligand (TRAIL) receptors are known as TNFRs, and initiate apoptotic pathways in a manner that is largely determined by the activity of the Fas-associated death domain protein (FADD). However, the key molecules that determine how each of these receptors activates apoptosis remain obscure. Here, we show that the mitogen-activated protein kinase phosphatase-1 (MKP-1, encoded by Ppm1G) blocks Fas-

mediated apoptosis. Expression of MKP-1 augmented the accumulation of apoptosis-inducing factors in Fas-mediated signaling cascades and in Fas-mediated apoptosis. The activity of MKP-1 was constitutively associated with TNFR1 and Fas, and inducible upon Fas signaling. Both DUSP1/MKP-1 and TNFR1 interacted with Fas-associated death domain protein (FADD) and c6a93da74d
